Global Volcanism Program | Current Eruptions

Volcanic Eruptions. The most common type of volcanic eruption occurs when magma (the term for lava when it is below the Earth's surface) is released from a volcanic vent. Eruptions can be effusive, where lava flows like a thick, sticky liquid, or explosive, where fragmented lava explodes out of a vent.

List of volcanic eruptions by death toll - Wikipedia

Some volcanic eruptions are explosive and others are not. The explosivity of an eruption depends on the composition of the magma. If magma is thin and runny, gases can escape easily from it. When this type of magma erupts, it flows out of the volcano. A good example is the eruptions at Hawaii's volcanoes.

How Do Volcanoes Erupt? - USGS

6. Volcanoes are classified as active, dormant or extinct. This refers to the amount of volcanic activity. "Active" means there's regular activity, "dormant" means there's been recent activity but the volcano is currently quiet, and "extinct" means it's been so long since the last eruption that it's unlikely to ever erupt again. 7.
